"Wayteko" Hotel
Spain, Alicante city

Main task: Management of the hostel and room fund. Creation of an access control scenario. The ability to quickly issue passes (PIN codes) remotely, generate reports, and revoke access rights when necessary.

Equipments: Wi-Fi controllers (AIR-CB) with a built-in exit button and third-party keypads .

Cons: The Lumiring solution enables the administration of user access rights with flexibility and ease. By harnessing the power of Wi-Fi connectivity, the system eliminates the need for cumbersome cabling, reducing damage to the building and cutting down on costs.

APP MACS Lite serves as the center for the system, controlling the settlement of tenants in the hotel's room fund by issuing restricted access codes to specific doors. Each tenant receives a unique PIN code valid only for the designated doors they are authorized to access, based on their individual schedules. The system can simulate a group check-in through the cardholder group operations.

With its comprehensive access control capabilities, the system ensures the security and safety of hotel guests and tenants while also providing management with detailed reports on access activity.
