

Housing estate “Kadorr” Ukraine, Odessa city

USER CASES

DESCRIPTION

Main task: Organization of access control in elevators to exclude the possibility of unauthorized access to the floors. Provide the ability to remotely manage tenant access rights. Allow residents to remotely grant access to their guests.

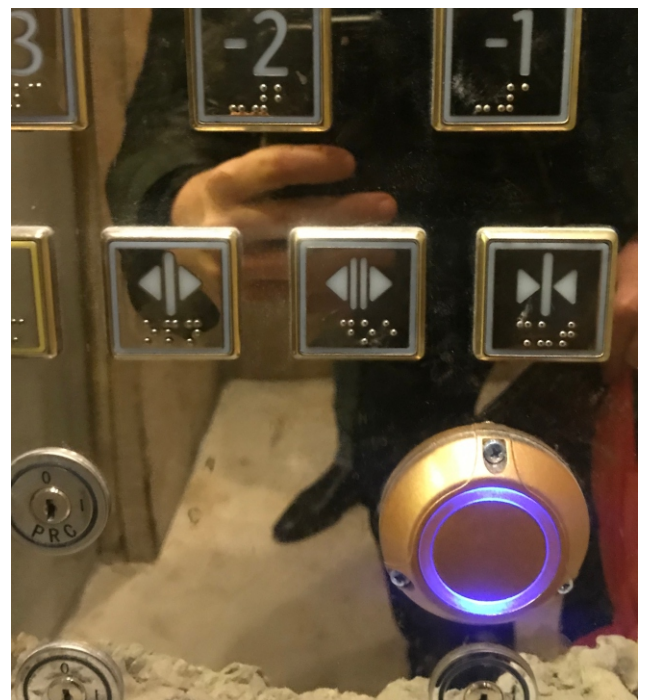

Equipments: Installed six Network Access Controllers All-in-one(AIR-CR)

Cons: The Lumiring solution enables flexible and easy administration of user access rights. There is no need for expensive and problematic cable wiring in elevators, as all devices work over a Wi-Fi connection.

The APP MACS Lite serves as the center of the system, controlling tenant access rights by issuing RFID tags with access to specific elevators in the housing estate. Each tenant receives the ability to install a mobile app for remote control and to control access to elevators for their own guests.

The administration company uses elevator access as an additional incentive for tenants to pay rent on time. If a tenant's balance is negative, they may

lose access to the elevator from the first floor and must use the stairs to access the elevator on the third floor.
